HARSHVARDHAN PAWAR SPEECH TO TEXT

Hi, my name is Harshvardhan Pawar. I will be testing the original website of MyGov Podcast and then comparing it with the website Soham and his teammates have made for their UI/UX assignment. All right, I am testing the original MyGov podcast website. My task is to find an agriculture-related podcast, play it, and figure out how to listen to another episode afterwards. I am looking at the homepage now. There are a lot of episodes, but finding something specific is not easy. I want agriculture content, so I am scrolling through the page. I can see episode titles, but I cannot quickly filter them by topic. I will keep looking. Okay, I found something that seems relevant. Let me click it. I cannot start playing directly from the cover. I need to open the episode and look for the audio option. But it's inconvenient. I just want to press play and listen. All right, it's playing now. Next, I want to find another agriculture episode to listen to afterwards. I am not seeing a clear queue option. I will probably have to go back, find another episode, and open it separately. It's a poor experience if I want to listen to several episodes in a row. The content is useful, but finding and playing it takes too much effort. Let's see if the redesigned website handles this better. Now I am using the website made by Soham and his teammates. I will repeat the same task: find an agriculture podcast, play it, and queue another episode. Okay, this is more straightforward. I can browse by topic, so I will select agriculture. Good. Now I can see relevant episodes without scrolling through everything. I will click play on this one. Nice. It starts immediately. No unnecessary steps. Now I want another episode to play next. I can add it to the queue while the current episode continues. That's exactly what I needed. Let me check the player, okay? I can see what's coming next and manage the queue from there. This is much better than the original website. I do not have to keep going back and forth between pages, and finding relevant content is faster. Honestly, this version makes more sense. The topic filters and queue solve the main problems I had. I can find what I want, start listening, and line up another episode without interrupting myself. I will definitely use this version. It's practically easy to understand and does what I expect a podcast website to do. Thank you.
