ARYA SHETTY SPEECH TO TEXT

Hello, my name is Arya Shetty. I will be today reviewing the original MyGov podcast with a website Soumil, Soham, and Ananya have made for their UI UX assignment. Okay, so now I am on the original MyGov podcast website. My task is to find a podcast episode, play it, and save it for later. Let's see how this goes. There are quite a few episodes here, but I am not really sure where to start. I will scroll a little and see what I can find. All right, I can see the episode covers and titles. Let me click on this one. It does not start playing. I expected the cover to have a clear play button. What's a little confusing. Maybe I need to open the episode page first. Let me try that. Okay, now I am on another page, but finding the audio controls still is not very obvious. Honestly, this is taking more effort than I expected. Let me go back and look for Mann Ki Baat. There are several episodes, and I am not sure which one to choose. Is there a search option? Okay, I will type Mann Ki Baat and check the results. Some titles look similar, so I have to read them carefully. All right, I think I have found the right one. Let me open it and try playing it. Okay, finally. But there were quite a few steps just to start listening. Now I want to save this episode and listen to it later. Is there a library or a save option? I cannot find anything obvious. Maybe I am missing it, but it's frustrating when such a simple action takes so much searching. I also want to explore other episodes while listening, but going back and forth between pages interrupts the experience. Overall, the website has useful content, but finding, playing, and saving episodes does not feel very smooth. I am spending more time figuring out the interface than enjoying the podcast. Okay, I am done with the original website for now. Let's try the redesigned version. Okay, so now I am using the website made by Soumil, Soham, and Ananya. I am going to perform the same task again: find an episode, play it, and save it for later. Oh, this already feels much clearer. I can see featured episodes and an obvious play button. Let me click it, and nice, the episode starts playing immediately. It's much better than the original website. I can also see the player at the bottom, so I can browse while listening, which is really useful. Now let me search for Mann Ki Baat. I will type it into the search bar. Oh, the results appear as I type. Great. I can find the episode much faster instead of scrolling through everything. Let me open this result and play it. Nice. The player is easy to access. I can pause, adjust the speed, and skip backwards or forwards. These controls make listening much more convenient. Now I want to save this episode for later. I will click Save. Okay, done. Let me check the library. Yep, there it is, and I can see my listening progress too, which is really helpful because I will not have to remember where I stopped. I also like the topic browsing feature. I can explore different episodes without knowing their exact titles, and the best part is that the audio keeps playing while I browse other sections, so I do not lose track of what I am listening to. Honestly, the difference is quite noticeable. On the original website, I felt confused and had to search around just to play an episode. Here everything feels more straightforward and connected. I really like this redesigned experience. Finding, playing, and saving podcasts is much easier, and the interface feels more user-friendly. I definitely prefer this version for regular listening. I think Soumil, Soham, and Ananya have addressed the main issues I experienced earlier. Overall, this feels smoother, simpler, and much more enjoyable.
